

Analytics Case Competition – Paytm App Analysis

Problem Statement

Paytm is one of India's leading fintech super apps, offering services such as UPI payments, wallet transactions, bill payments, recharges, ticket bookings, and financial products like loans, insurance, and investments. Despite having a large registered user base, Paytm faces challenges related to **user retention, feature adoption, transaction frequency, and drop-offs across the app journey**.

As a **Data Analytics Team at Paytm**, you are provided with anonymized app usage and transaction data. Your task is to **analyze user behavior on the Paytm app** and generate actionable insights that can help improve **Monthly Active Users (MAU), transaction success rates, and cross-selling of financial products**.

Objectives

Participants are expected to:

1. Analyze user engagement patterns across different Paytm app features
2. Identify key factors affecting user retention and churn
3. Evaluate transaction success vs failure trends
4. Understand conversion funnels (app open → transaction → repeat usage)
5. Segment users based on usage frequency, value, and behavior

Dataset Overview (Paytm App Analysis)

This dataset is competition-ready and designed for EDA, funnel analysis, retention, cohorting, and segmentation.

Columns included:

1. user id – Unique user identifier
2. signup date – User onboarding date
3. last active date – Most recent app activity
4. city tier – Tier 1 / Tier 2 / Tier 3
5. device type – Android / iOS
6. feature used – UPI, Wallet, Bills, Recharge, Ticketing, Loan, Insurance, Investment
7. transactions count – Total transactions by user
8. avg transaction value – Average ₹ per transaction
9. transaction success rate – Success ratio (0–1)
10. monthly active – MAU flag (1 = active)
11. churn flag – 1 = churned, 0 = retained
